

WHAT IS CLAIMED IS:

- SAC 01
1. A liquid crystal shutter comprising:
a liquid crystal device including a nematic liquid crystal sealed
in between a first transparent substrate and a second transparent
substrate on whose inner surfaces are formed respective transparent
electrodes, said liquid crystal device having a twisted angle equal to or
greater than 180°; and
a pair of polarizing plates between which are sandwiched said
first transparent substrate and said second transparent substrate, said
polarizing plates having respective absorption axes which are
substantially orthogonal to each other, said absorption axes of said
polarizing plates being angled within a range of $\pm 40^\circ$ to $\pm 50^\circ$ relative to
a direction in which intermediate liquid crystal molecules are orientated,
said direction indicating a direction of orientation of said liquid crystal in
an intermediate portion in a direction of thickness of said liquid crystal
device.
2. A liquid crystal shutter comprising:
a liquid crystal device including a nematic liquid crystal sealed
in between a first transparent substrate and a second transparent
substrate on whose inner surfaces are formed respective transparent
electrodes, said liquid crystal device having a twisted angle equal to or
greater than 180°; and
a pair of polarizing plates between which are sandwiched said

PCT/EP2004/000268

first transparent substrate and said second transparent substrate, said polarizing plates having respective absorption axes which are substantially orthogonal to each other;

wherein

5 Δ_{nd} lies within a range of 600 to 900 nm, said Δ_{nd} being the product of a birefringence Δ_n of said nematic liquid crystal and a gap d between said first transparent substrate and said second transparent substrate.

10 3. A liquid crystal shutter according to claim 1, wherein

Δ_{nd} lies within a range of 600 to 900 nm, said Δ_{nd} being the product of a birefringence Δ_n of said nematic liquid crystal and a gap d between said first transparent substrate and said second transparent substrate.

15

4. A method of driving the liquid crystal shutter according to claim 1, wherein

 a single drive term of said liquid crystal shutter is divided into a reset term during which all pixels of said liquid crystal shutter are
20 rendered closed and a scan term during which all the pixels or predetermined pixels are rendered opened or half-opened;

 the duration of said scan term being made shorter than a holding time taken for a transmittance of said liquid crystal shutter to start to lower after it has reached its maximum with no driving voltage applied to
25 said liquid crystal shutter.

5. A liquid crystal shutter driving method according to claim 4,
wherein
a positive or negative driving voltage is applied to said liquid
5 crystal shutter during a partial period within said scan term, said driving
voltage being set to 0V during a remaining period, said period during
which said driving voltage is set to 0V being varied to perform a gradation
display.
- 10 6. A liquid crystal shutter driving method according to claim 4,
wherein
the voltage applied to said liquid crystal shutter in said scan
term is varied from 0V to perform a gradation display.
- 15 7. A liquid crystal shutter driving method according to claim 4,
wherein
a single driving term of said liquid crystal shutter is controlled,
depending on an operating temperature, so as to be increased at a time of
a low temperature but reduced at a time of a high temperature.
- 20 8. A method of driving a liquid crystal shutter according to claim 1,
wherein
a single driving term of said liquid crystal shutter is assigned to
a scan term during which all pixels or predetermined pixels of said liquid
25 crystal shutter are rendered opened or half-opened, said scan term being

controlled, depending on an operating temperature, so as to be lengthened at a time of a low temperature but shortened at a time of a high temperature.

- 5 9. A method of driving a liquid crystal shutter according to claim 2,
wherein

a single drive term of said liquid crystal shutter is divided into a reset term during which all pixels of said liquid crystal shutter are rendered closed and a scan term during which all the pixels or
10 predetermined pixels are rendered opened or half-opened;

the duration of said scan term being made shorter than a holding time taken for a transmittance of said liquid crystal shutter to start to lower after it has reached its maximum with no driving voltage applied to said liquid crystal shutter.

15

10. A liquid crystal shutter driving method according to claim 9,
wherein

a positive or negative driving voltage is applied to said liquid crystal shutter during a partial period within said scan term, said driving
20 voltage being set to 0V during a remaining period, said period during which said driving voltage is set to 0V being varied to perform a gradation display.

11. A liquid crystal shutter driving method according to claim 9,
25 wherein

DOCUMENT FILED 4/15/2000

the voltage applied to said liquid crystal shutter in said scan term is varied from 0V to perform a gradation display.

12. A liquid crystal shutter driving method according to claim 9,
5 wherein

a single driving term of said liquid crystal shutter is controlled, depending on an operating temperature, so as to be increased at a time of a low temperature but reduced at a time of a high temperature.

- 10 13. A method of driving a liquid crystal shutter according to claim 2,
wherein

a single driving term of said liquid crystal shutter is assigned to a scan term during which all pixels or predetermined pixels of said liquid crystal shutter are rendered opened or half-opened, said scan term being 15 controlled, depending on the operating temperature, so as to be lengthened at a time of a low temperature but shortened at a time of a high temperature.

14. A method of driving a liquid crystal shutter according to claim 3,
20 wherein

a single drive term of said liquid crystal shutter is divided into a reset term during which all pixels of said liquid crystal shutter are rendered closed and a scan term during which all the pixels or predetermined pixels are rendered opened or half-opened;

25 the duration of said scan term being made shorter than a holding

time taken for a transmittance of said liquid crystal shutter to start to lower after it has reached its maximum with no driving voltage applied to said liquid crystal shutter.

- 5 15. A liquid crystal shutter driving method according to claim 14,
wherein

a positive or negative driving voltage is applied to said liquid crystal shutter during a partial period within said scan term, said driving voltage being set to 0V during a remaining period, said period during
10 which said driving voltage is set to 0V being varied to perform a gradation display.

16. A liquid crystal shutter driving method according to claim 14,
wherein

15 the voltage applied to said liquid crystal shutter in said scan term is varied from 0V to perform a gradation display.

17. A liquid crystal shutter driving method according to claim 14,
wherein

20 a single driving term of said liquid crystal shutter is controlled, depending on the operating temperature, so as to be increased at a time of a low temperature but reduced at a time of a high temperature.

18. A method of driving a liquid crystal shutter according to claim 3,
25 wherein

a single driving term of said liquid crystal shutter is assigned to
a scan term during which all pixels or predetermined pixels of said liquid
crystal shutter are rendered opened or half-opened, said scan term being
controlled, depending on the operating temperature, so as to be
5 lengthened at a time of a low temperature but shortened at a time of a
high temperature.
